## (54) CORROSION DIAGNOSING METHOD FOR INTERNAL SURFACE OF TUBE

## (57) Abstract:

PURPOSE: To investigate the corrosion of the tube in a short time without simulation experimentation by stacking a test-piece which have plural standard recesses at the periphery of a part of the tube to be inspected and irradiating it with X rays, forming an X-ray transmission image of the test-piece and the part to be inspected and reading the image by an image sensor.

CONSTITUTION: The test-piece 3 having the standard recesses 32 differing in depth is stacked at the periphery of the inspected part 2 of the tube 1 and irradiated with th X rays to form th X-ray transmission image of th test-piece 3 and inspected part 2 on an X-ray film 5, whose X-ray transmission image is read by the image sensor and inputted to an image processing mans. The density of the standard recesses 32 is calculated by subtracting the density of the periphery of the recess positions of th test-piece 3 in the read

image from the density of the recesses and a regression expression of the density of th standard recesses 32 and the depth of th standard recesses 32 is calculated. Then the recess depth of the inspected part 2 is calculated from the regression expression of the density and depth of the standard recesses 32 and a calculated recess depth distribution is displayed. Consequently, even a person who is not an expert can obtain the corrosion distribution in a short time without any simulation experimentation.
